Dr. Joshua L. Pughe-Sanford

youtube | email | website | scholar

Theoretical, computational, and mathematical physicist specializing in nonlinear dynamics and theories of learning and inference in neural systems

---

Experience

Research Scientist 2026–Present
Principia Princeton, NJ

Flatiron Research Fellow 2023–2026
Flatiron Institute, Center for Computational Neuroscience New York, NY

Education

Ph.D. in Physics · M.S. in Mathematics (GPA: 3.9) 2017–2023
Georgia Institute of Technology, Center for Non-Linear Dynamics Atlanta, GA

B.S. in Physics · Minor in Mathematics (GPA: 3.9, Highest Honors) 2013–2017
Emory University Atlanta, GA

Awards

Presidential Fellow · Herbert P. Haley Fellow · Phi Beta Kappa Honors Society

Teaching and Mentorship Experience

Flatiron Institute *2023–2026*

Mentored six graduate students, resulting in publication [1, 4].

Georgia Institute of Technology *2017–2023*

Mentored three undergraduate students, resulting in publication [6].

Promoted to lead teaching assistant, training and managing 30 graduate TAs.

Received on average **4.9/5** on teaching evaluations.

Taught graduate lectures on nonlinear dynamics and mathematical methods for physicists.

Service

Diversity, Equity, and Inclusion Committee, *at Simons Foundation* *2024–2026*

Advocated for more inclusive hiring practices across the institution.

Led intern selection for my research group from 500+ applicants, prioritizing candidates underrepresented in science.

Physics Allies for Wellness, *at Georgia Institute of Technology* *2020–2023*

Co-founded an organization providing support, resources, and action plans for those facing injustice and inequity in the physics department.

Graduate Association of Physicists, *at Georgia Institute of Technology* *2018–2020*

Research Summary

Principia, *with A. Saxe and J. Lee* *2026–Present*

Building theoretical model organisms of learning: architectures simple enough to study from first principles, yet sophisticated enough to explore phenomena seen in large models. Personas and emergent misalignment are of particular interest.

Flatiron Institute, *with A. Williams* *2025–2026*

Investigated how sufficient statistics are represented in recurrent neural architectures during sequential inference tasks [1].

Characterized which hidden Markov processes are easily filtered by linear RNNs, shedding light on where complicated architecture is needed and, importantly, where it is *not* [2].

Flatiron Institute, *with D. Chklovskii* *2023–2025*

Engineered interpretable, dynamical models of neural computation through the lens of observability [5] and controllability [7].

Georgia Institute of Technology, *with R. Grigoriev* *2017–2023*

Generalized the Axiom A framework of low-dimensional chaos to fluid turbulence [8]. In particular, we presented evidence that turbulence is well predicted over short time intervals by invariant sets [9–11]. We then showed that, over long time scales, ergodic averages can be computed accurate from even a meager amount of such sets [6].

Emory University, *with S. Boettcher* *2015–2017*

Derived scaling laws for the rate at which a quantum wavefunction will spread out over a self-similar lattice, and validated these results *in silico* [12].

Explored computational complexity advantages of quantum versus classical algorithms [13].

Princeton University, *with F. Calaprice* *2013–2017*

Helped design, fabricate, and deploy a dark matter detection experiment.

Automated and improved the purification process that removes radioactive contaminants from the detector, improving its sensitivity.

Oxford College, *with R. Conceicao* *2013–2015*

Analyzed the Collatz conjecture and its polynomial variant, producing asymptotic approximations for total stopping time.
